

## ABSTRACT OF THE DISCLOSURE

An electronic device capable of counting down to an integral  
time point has an integral time point selector for setting an  
integral time point. A timer serves for recording the current time.  
A synchronous calculating unit serves for reading the integral  
time point from the integral time point selector and reading the  
current time from the timer. The time interval from the current  
time to the integral time point is calculated as a counting down  
time period. A counter serves for reading the counting down time  
interval from the synchronous calculating unit and starting to  
count down.
